Mercury — Senior Product Designer, Accounting Integrations

---

Hi,

I'm not a designer learning accounting for this role — I run a private tax practice, I built its software, and I built the pipeline that carries a client's documents all the way to the books. That's the closest thing I have to your problem statement: people bouncing between banks, spreadsheets, and receipts just to prepare transactions for their books. I live in that exact friction every quarter for 150+ clients.

A few specifics:

**I customized an open-source invoice extractor (Well, by WellApp.ai) into an extraction-to-books pipeline.** The part I built is the layer between extraction and a filed return: a bridge that maps every line item to one of 28 Schedule C categories, assigns the quarter from the transaction date, and writes it into the client's books — additive only, never overwriting a hand-entered row. The same pipeline feeds per-client financial dashboards and, for nonprofit clients, an auto-filled Form 990 from the general ledger. I'm precise about this in interviews too: Well does the reading, I built everything between the reading and a filed return.

**Designing for accuracy tools first has a measurable result.** ReconcileIQ, the reconciliation app I designed and built, cut reconciliation time from 2–6 hours to under 90 minutes. My own tax-practice software cut per-client quarterly processing from 1–2 hours to 15–20 minutes. I don't just believe simplification works — I've watched the clock on it.

**Most recently I've been the product designer and builder for TOBA,** a 47-year-old Tampa nonprofit with 500+ members that had no system to collect dues at all before this platform. I worked with its board as product stakeholders through a monthly cadence and full-board reviews, delivered a written SOP and continuity-agreement handoff, and navigated three real board objections — data sovereignty, duplication with an internal effort, infrastructure cost — to a shipped result. (A one-page decision record on that consolidation is attached.)

I treat AI as a tool, not a replacement, in both my process and the products I build: the extraction-to-books pipeline is the clearest example — a model reads, but a person categorizes, quarter-assigns, and reviews every row before it counts.

I'd like to bring that same instinct — clarity over complexity, a person owning every consequential decision — to Mercury's Accounting Integrations team.
